

## STARTING TO USE THE MCU NS IRS HEATING BOX

WO25.x series

## FIRST THINGS TO DO BEFORE GOING FURTHER

### **1. Check the mechanical integration.**

- Do you need NSIRS Standard or do you need optional cooling

### **2. Select the right plugs to power the NS-IRS**

- We can provide you with standard sets of harting plug
- Or you can order parts from harting

### **3. Select the regulation mode : POWER or VOLTAGE**

## **IRS must be installed on the machine in a ventilated area....**

The IRS can operate with ambient temperature up to 45 dC, in open air. When confined to a close volume, or if higher ambient temperature are reached (up to 55 dC), the IRS must be equipped with a specific cooling unit

**WO20.11** NSIRS10 With the standard cooling option

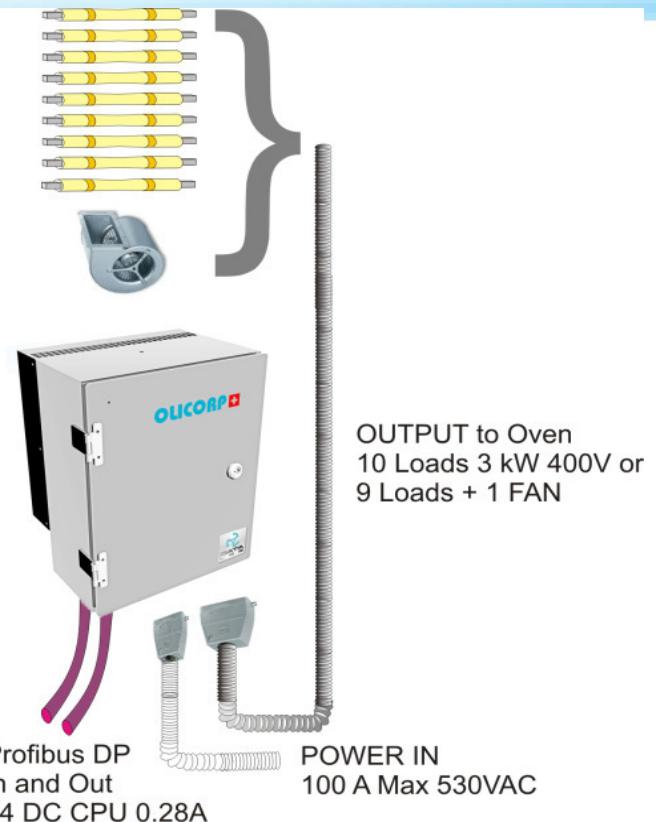

**WO20.15** NSIRS10 with cooling option for replacement of OLD IRS or PWR models (up to model WO20.5)

## POWERING the IRS

65 Amps 360/530 V are necessary for the power supply

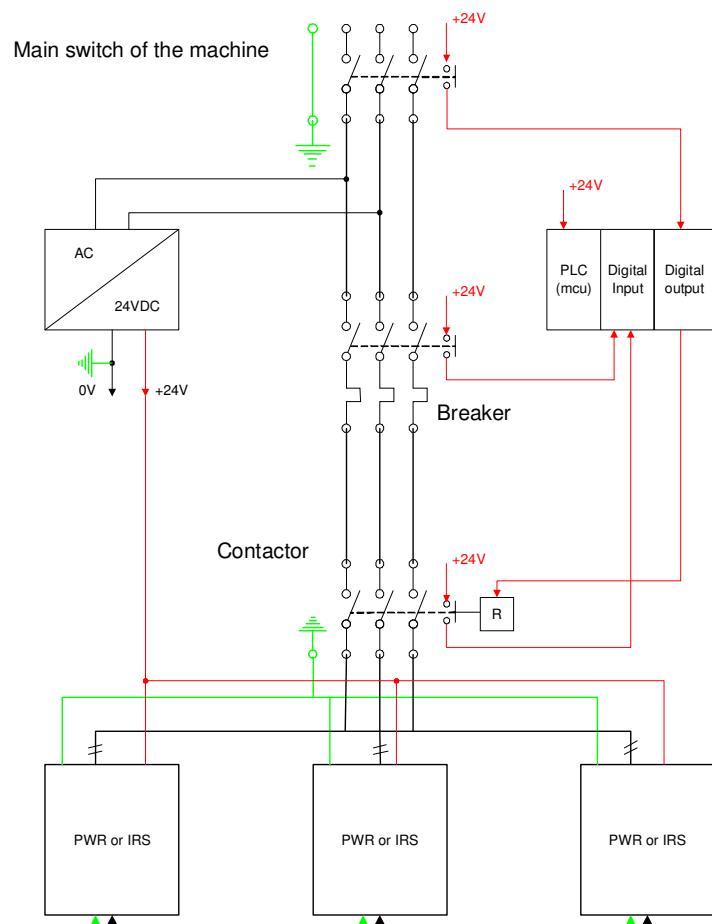

The IRS must also be connected to :

- 24 DC command 0.28 A consumption
- Profibus DP in and out

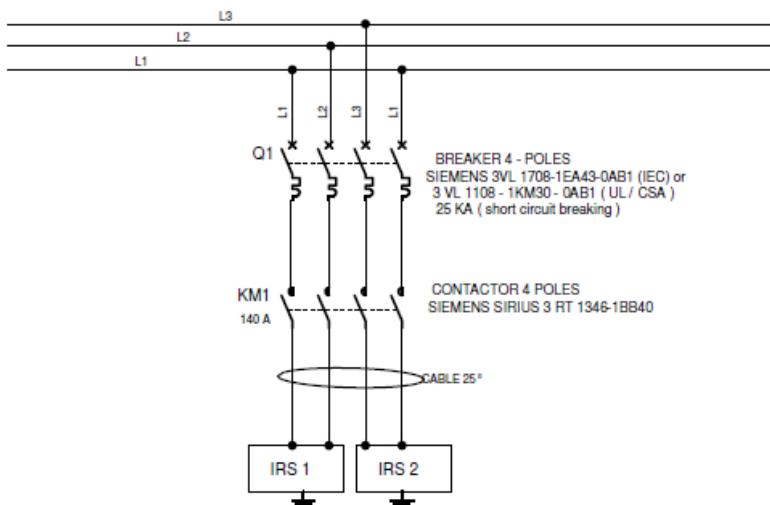

## Authorized lamps configuration :

	Power supply Voltage (VAC) +/-10%					
Lamp Nominal Voltage(Vrms)	208	230	400	415	440	480
230	-----	1700	1000	950	900	820
360	-----	-----	2400	2300	2200	2000
400	-----	-----	3000	2900	2700	2500

breaker 80A, breaking capacity at least 25KA, I magnetic 600 to 800A

## Merlin Gerin NS100 80A 25KA

## CHOOSING THE HARTING SETS : (We suggest WO10.6, WO22.1, WO23.1)

24 DC and PROFIBUS  
Input and output

Connection to Oven

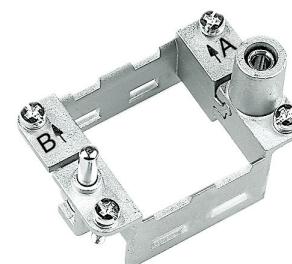

Power Supply

**Assembled MF**  
• 120 cm WO10.6  
• 500 cm WO10.7  
• 800 cm WO10.8

**Assembled M**  
• 500 cm WO11.3  
• 800 cm WO11.4  
• 1000 cm WO11.5

Kit components WO23.X

Kit components WO22.X

**KIT includes 1 green and all blue components.**

## **CHOOSING BETWEEN VOLTAGE REGULATION AND POWER REGULATION**

**The choice of the regulation mode require to select a specific firmware.**

To update the firmware, one must use the supervisor program

VOLTAGE REGULATION : FIRMWARE 20.xx HW 101

POWER REGULATIORN : FIRMWARE 5.xx HW20

### **Procedure :**

- Install supervisor on a PC
- Connect to IIRS using a serial cable
- Upload the firmware
- Configure the setting of the IRS according to images next page.

## VOLTAGE REGULATION FIRMWARE BEST CONFIG

**POWER REGULATION FIRMWARE  
BEST CONFIG**

## PROFIBUS DP Configuration :

1. Connect the IRS to a PROFIBUS DP Master

*Bus Termination 50 Ohms ON / OFF*

2. Configure the network using olic0594.gsd

- Protocole
  - IRS\_PWR\_STD12
  - IRS\_PWR\_STD12\_SHORT

SHORT is easier to work with.

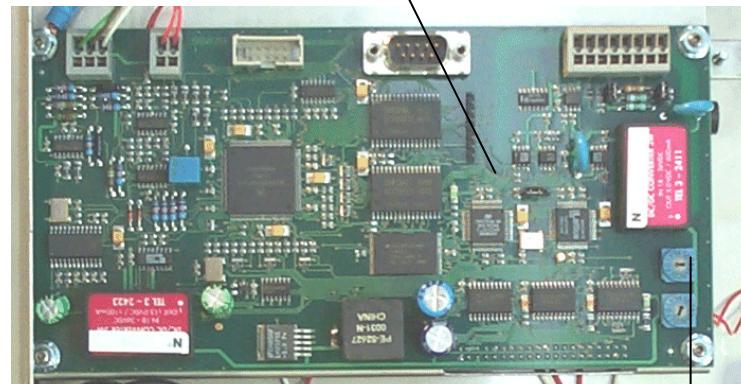

In STD12 we need to provide

- Lamp configuration (Voltage, power), Power settings for the regulation and On/off command

In STD12 Short.

- The lamp configuration is stored in the flash memory of the IRS and doesn't need to be passed through profibus.

LED Green  
Profibus OK

Profibus ID

Command	Reserved.	P not Ok		BL		Sqr(Vrms)			
0	1	2	3	4	5	6	7	8	9

**Byte 0 : Command byte content :**

bit	Meaning
1	<i>Reserved</i>
10	<i>Reserved</i>
100	<i>Reserved</i>
1000 <i>Read Only</i>	1 = Alarm “Overload” 0 = Normal state.
10000 <i>Read Only</i>	1 = Regulation ON (ON Command acknowledge) 0 = Regulation OFF
100000 <i>Read Only</i>	1 = Alarm “CutOut” (Breaker) 0 = Normal state.
1000000 <i>Read Only</i>	1 = Alarm “OverHeat” 0 = Normal state
10000000 <i>Read Only</i>	1 = Alarm “SectorDefault” 0 = Normal state.

**Byte 2 and 3 : P not Ok byte content :**

1 bit per lamp. The bit is turned to 1 when the Ns-IRS can not apply the required power to the given lamp. 4 bits reserved.

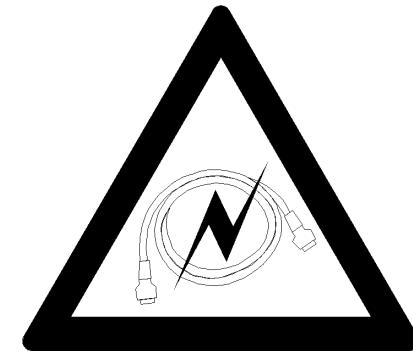

V1	V2	...	V1 2	Rs 1	...	Rs 4
<i>bit0</i>	<i>bit 1</i>			11	12	

**Byte 4 and 5 : BL Dead Lamp byte content :**

1 bit per lamp. The bit is turned to 1 when the NS-IRS detects a load fault

L1	L2	...	L12	Rs 1	...	Rs 4
<i>bit0</i>	<i>bit 1</i>			11	12	

		Exception	Effect
Software treatment of the exception	An alarm is emitted The regulation can be stopped	Sector Default : Vsupply < 100V during more than 1 second	The regulation stops. An alarm is sent to the PLC. The system needs a software reset to restart (regulation off and then on)
		Power not reach : Power applied < power expected	The regulation goes on, an alarm is sent to the PLC
		Dead lamp	The regulation goes on, an alarm is sent to the PLC
		OverLoad I > 200 A	The regulation stops. An alarm is sent to the PLC. The system needs a software reset to restart (regulation off and then on)
		Temperature to high	The regulation stops. An alarm is sent to the PLC
	No alarm	Profibus down	The regulation is stopped and will start again when the Profibus DP will be back
No treatment	24 VDC down		Should never happen when main supply is on. The regulation stops.
	PLC failure		If the Profibus watch dog is not affected, the NS-IRS can not see it. The regulation goes on.
	24 VDC starts after the HV supply		Should never happen. Non deterministic. It can damage the electronics.
	The current in one channel is higher than 7.5 A continuously but the total current remains below 200 A		We can not detect that. After a while the thyristor will be damaged.

## Thank you
